Web Design End-of-module Project

This project is used to determine and exercise your skill level in using and combining HTML, CSS, and Bootstrap to build a beautiful frontend project.

During this project you need to keep **responsive** and UX principles in mind while completing this project.

Brief:

You are tasked to develop a single page frontend site using any technology at your disposal. You are urged to use Bootstrap as a CSS framework and bonus points if you use a CSS preprocessor for custom styling.

Requirements:

You are tasked to build a site for managing user profiles of a company. The profiles should be displayed in card format with the following details on them:
- User's profile picture. (use a placeholder picture for this project)
- User's first and last name.
- User's email.
- User's cellphone and landline number.

When clicked on the card, it should bring up a modal with the user's further details. These extra details should be:
- User's home address.
- User's next of kin name.
- User's next of kin relationship.
- User's next of kin cellphone number and email.

The card should have the option to delete the user, when clicked it needs to display a popup modal/confirmation message (it does not actually have to delete the cards, just display a confirmation modal).

You should include a button on the page that will bring up an input form for a new user with all of the above fields.

You are welcome to exchange some of the modals for new pages to convert this to a multi-page site, but your page has to include one modal.

The site should include a navigation bar and breadcrumbs if you are building a multi-page site. Include the following placeholders in your navigation bar:
- Home
- News Feed
- Users
- Admin

The forms do not need to be hooked up to a backend and you should include at least 4 mock user profiles.
